

TEST

Resume—JD Matching Tool

With AI Scoring

PROBLEM STATEMENT

Create a tool that compares a resume and a job description (JD), extracts relevant skills, and produces a match score with an explanation.

INPUT

- Upload / resume text and JD text (or form fields).

BACKEND

- Parse resume and JD (simple text extraction if no PDF parser).
- Extract skills / entities from both using LLM or simple NLP.
- Compute a match score, which could be based on:
 - Overlap of skills.
 - LLM-based semantic similarity.
 - Weighted scoring (e.g., must-have vs. nice-to-have skills).
- Generate an explanation:
 - Which skills match.
 - Which important skills are missing.
 - Suggestions for improvement.

FRONTEND

- Show resume, JD, match score, and explanation.
- Optionally highlight matched / missing skills.

EXPECTED OUTPUT

A working tool where the user provides a resume and JD, and the system shows:

- Match score (e.g., 0–100).
- Breakdown of matched and missing skills.
- Narrative explanation.

At a glance

Test	Focus	Core AI task	Primary output
01	Resume—JD Matching	Skill extraction + match scoring	Score + narrative explanation
